

Custom styling with PDF backgrounds

You can design your own custom templates in an external PDF document and use it as a background for your YMPrint document (as you can see in this document). The fields are populated and the form fields are flattened so that the populated values look like normal PDF content.

The PDF content from the report is overlayed on top of the existing document content in the background.

Auto-populated PDF form fields from variables

One of the original design intents of inline document variables is to use them to dynamically populate PDF form fields. By doing so, you can create documents with dynamic headers that give the illusion of working with a more sophisticated page layout software.

Form fields are *automatically* populated when a document variable name exactly matches the PDF form field name.

If you want to avoid this behaviour

- Make sure that none of your variable names match your field names (i.e. using a special naming convention for your form field names to prevent accidental clashes)
- Do not use form fields

Example

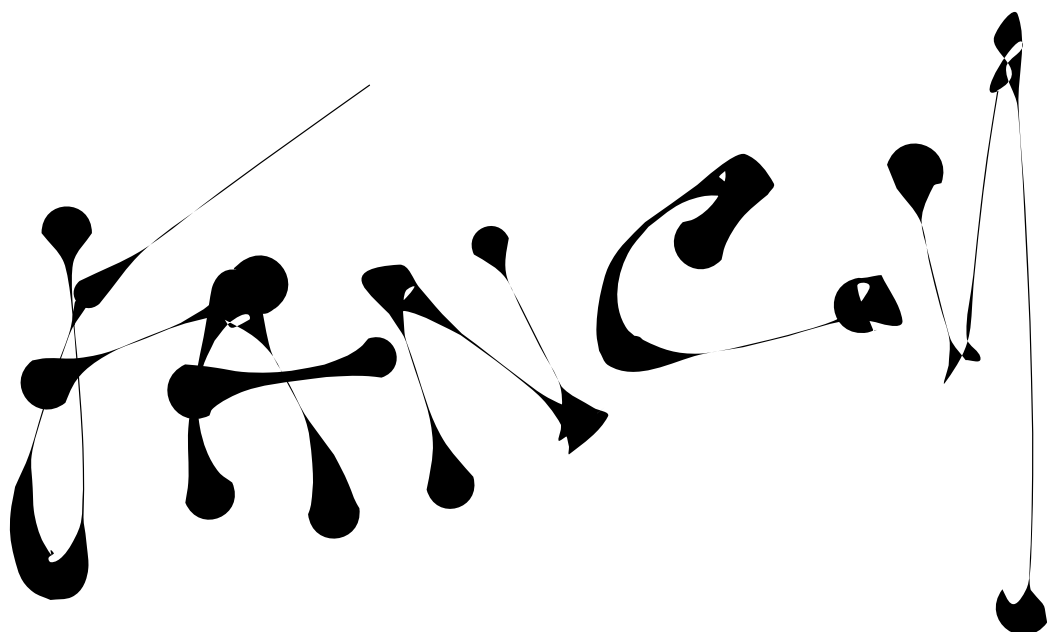

The form fields below have been populated from the document vars

Fancy Grafitti
