

Text formatting showcase

This opening paragraph uses the default body style: justified text at 11 pt, prepared by Structural Python. The heading above is underlined because the heading style sets underline: true.

Alignment and named styles

The default body is justified. Named text styles let us switch the active family for part of the document, and each style can carry its own alignment.

Fine print (switched inline)

Everything from here down in this section renders in the fine-print style — 7 pt and grey. Because switching swaps the whole family, this section's heading is scaled down to match.

A nested sub-clause

- This bullet inherits fine-print from its parent scope.
- So does this one.

And now the default style is restored for the remainder of this section.

Callout (centered)

This paragraph uses the callout style: larger, blue, and centered.

Legal notice (right aligned, underlined body)

This paragraph is right-aligned and underlined, driven entirely by the 'notice' named style rather than the heading style.

Ordered content

Back to the default style. Numbered lists render with the active family too:

subitems

1. First numbered item
2. Second numbered item
3. Third numbered item

Mapping-key switch

A final note

This subsection switches style using the mapping-key form of `_textstyle` (a key inside a mapping, rather than a list item) and renders in fine-print.
